- Be able to manage events and who is the owner/invited/accepted
- Be able to create user profiles
- Be able to store events and stories on a server
- Be able to fetch data from the server
- Be able to sync with the server on app startup and load events
- Be able to delete stale data from server

User Stories for Release

Sprint 1:

(34 points) Be able to create events using a GUI

(13 points) Be able to see previous events

(21 points) Be able to see sent/received notifications

Sprint 2:

(21 points) Be able to have a polished GUI that allows a user to accept/decline invitations   as well as handles input errors.

(34 points) Be able to store and fetch everything on a server

(21 points) Be able to sync with the server on app startup and load events

(34 points) Be able to have a Profile for each user

Sprint 3:

(21 points) Automatically delete expired events from the server as well as their invitations.

(21 points) Perform thorough testing on event/invitation creation and deletion

(8   points) Write a manual that properly outlines user interactions

(21 points) Polish the UI and add animations for tab changes as well as pop ups.

(8   points) Expand Profiles to include profile pictures

Product Backlog

There were a lot of features that would allow the project itself to look better and have an enhanced GUI but sadly, that will have to wait till next quarter. The idea to add pictures as well as other smaller luxuries to events was also thoroughly discussed but we're not quite certain if we will be able to implement it in this release.

Another possibility that was being explored was having a 'Local Events' tab, which will also be implemented in the next release which will allow events to have a location and allow you to find public events nearby.
